

# DAY- 12

## AWS ROUTE 53

# AWS Architecture and Design

---

1. Day 1 Overview of Cloud Computing
2. Day 2 Overview of AWS
3. Day 3 Amazon EC2\*
4. Day 4 Amazon EBS \*
5. Day 5 Amazon CloudWatch \*
6. Day 6 Amazon S3\*
7. Day 7 Amazon Elastic Load Balancer \*
8. Day 8 Amazon Auto Scaling \*
9. Day 9 Amazon VPC \*
10. Day 10 Amazon IAM \*
11. Day 11 Amazon RDS
- 12. Day 12 Amazon Route 53 \***
13. Day 13 Amazon DynamoDB\* & Glacier
14. Day 14 Amazon Cloudfront\* & Import Export & Amazon SES \*
15. Day 15 Amazon ElasticBeanStalk & Amazon Cloudformation & Amazon OpsWorks
16. Day 16 AWS Economics & AWS Account Overview \*
17. Day 17 AWS Architecture
18. Day 18 AWS Certification Preparation

[With Hands on Demo]

# AWS Route 53

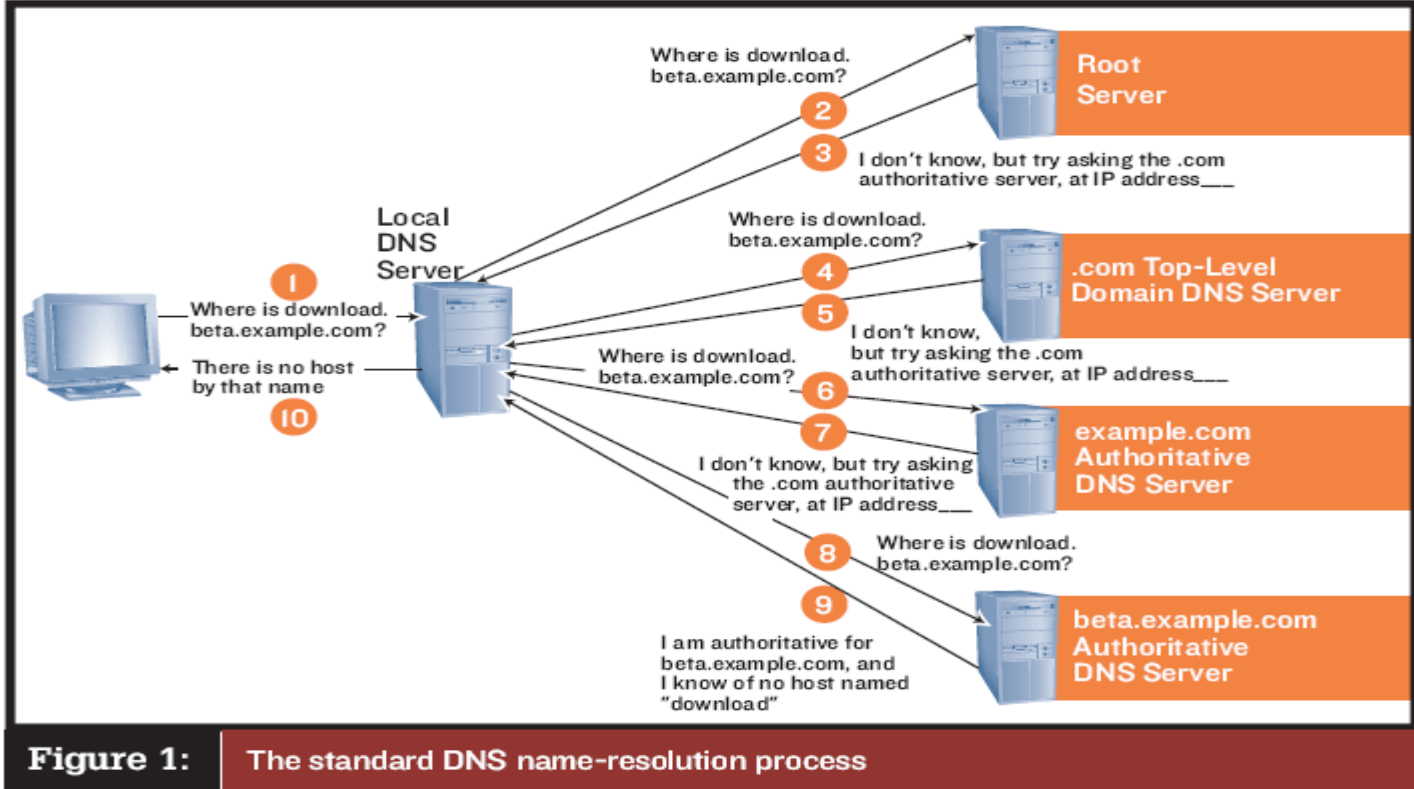

# AWS Route 53

---

- What is Route 53?
- Route 53 Features
- Demo

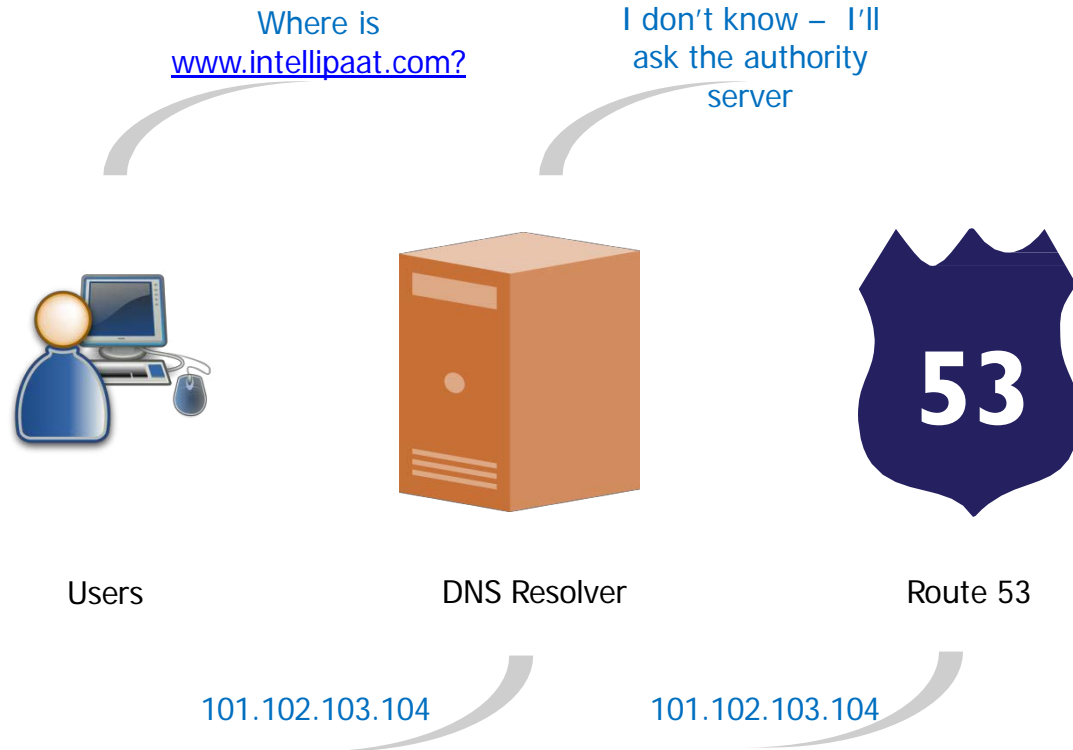

# Domain Resolution Process

**Figure 1:** The standard DNS name-resolution process

# How Route 53 Works?

# Route 53 Key Features

---

Amazon Route 53 is a highly available and scalable cloud Domain Name System (DNS) web service.

Amazon Route 53 effectively connects user requests to infrastructure running in AWS – such as Amazon EC2 instances, Elastic Load Balancing load balancers, or Amazon S3 buckets – and can also be used to route users to infrastructure outside of AWS.

Fast, easy to use, and cost-effective.

Answers DNS queries with low latency by using a global network of DNS servers (More than 50).

If you need a domain name, you can find an available name and register it using Amazon Route 53.

# Route 53 Key Features

---

## Reliable

- 54 Edge Locations
- Supported by AWS SLA

## Fast

- Worldwide anycast network
- Fast propagation of changes across edge networks

## Integrated with AWS

- ELB-Alias Queries. Map the root or apex of your hosted zone to your Elastic Load Balancer.

## Easy to Use

- SDK, CLI, Programmatic API
- Management Console

## Cost Effective

- Cheaper
- Pay as you go model

## Flexible

- Supports Weighted Round Robin, Specify the frequency with which different responses are served.
- Run applications in multiple AWS regions and route users to the one that provides the lowest latency with Latency based routing.

# Pay-as-you-go Pricing

---

- 📦 **Hosted Zones**
  - \$0.50 per hosted zone / month for the first 25 hosted zones
  - \$0.10 per hosted zone / month for additional hosted zones
- 📦 **Standard Queries**
  - \$0.500 per million queries – first 1 Billion queries / month
  - \$0.250 per million queries – over 1 Billion queries / month
- 📦 **Latency Based Routing Queries**
  - \$0.750 per million queries – first 1 Billion queries / month
  - \$0.375 per million queries – over 1 Billion queries / month
- 📦 **Alias queries for ELBs free of charge**

# Latency Based Routing (LBR)

---

- You can host your application in different EC2 regions around the World.
- Create LBR records using the Route 53 API or Console
  - Tag each destination end-point to the EC2 region
  - End-points can either be EC2 instances, Elastic IPs or ELBs
- Route 53 will route end users to the end-point that provides the lowest latency.

# LBR Benefits

- Improved performance & reliability than single region
- Easy to Manage and Implement
- Cheaper

# Weighted Round Robin

---

Weighted Round Robin allows you to assign weights to resource record sets in order to specify the frequency with which different responses are served

Weighted Round Robin: Resolve to different values for the same record with different, user-controlled probabilities

You may want to use this capability to do A/B testing, sending a small portion of traffic to a server on which you've made a software change.

For instance, suppose you have two record sets associated with one DNS name—one with weight 3 and one with weight 1. In this case, 75% of the time Route 53 will return the record set with weight 3 and 25% of the time Route 53 will return the record set with weight 1. Weights can be any number between 0 and 255.

Name	Type	Value	Weight
intellipaat.com	A	101.102.103.104	4
Intellipaat.com	A	101.102.103.105	1

# DNS Fail-over

DNS Fail-over feature gives you the power to monitor your website and automatically route your visitors to a backup site if it goes down.

## Health Checks

Configure a health check to make requests such as requesting a web page from a specific URL.

view the current and recent status of health checks.

Receive Notifications

## Failover

Supports Active-Active & Active-Passive failover

Add health checks to all of the resource record sets in a group of weighted resource record sets with all resource as nonzero weights. This is an active-active fail-over configuration.

Add health checks to all of the resource record sets in a group of weighted resource record sets with **some** resource as nonzero weights. This is an active-passive failover configuration

# Customers using Route 53

---

In the next video we will do hands on with AWS Route 53

# Thank You
